

# KEEP A CAP ON YOUR TYRE COSTS

The VIGIA air pressure tyre maintenance system for BPW trailer axles will help you reduce your third largest operating expense by ensuring that both the inside and outside tyre of your dual sets run at the same pressure, even when a tyre has a slow leak.

This will reduce the incidence of

- premature and uneven tyre wear
- blow outs
- accidents

Fuel consumption is also improved when tyres are run at optimum pressure.

VIGIA proven tyre pressure maintenance systems maintain a constant 'pre-set' tyre pressure and delivers instant, ongoing feedback to the driver.

The system is designed to operate independently on any trailer configuration or make. Air to the tyres is supplied through conduits inside the axle and the exclusive, durable rotary valves are placed outside the hubcap to prevent water and dust entering the axle hub.

Vigia is highly durable for the toughest of trucking environments and most important, eliminates unsafe tyre worries, reduces operating costs, down time and is available as an option on BPW.
